

iVote — Complete Feature Overview

QR-Based Feedback & Engagement Platform for Physical Venues

Prepared for marketing use — September 2026

1. What iVote Is

iVote turns any physical location — a restaurant table, a gym, a salon chair, a hotel room, an event entrance, a hospital waiting room — into a measurable feedback channel. A guest scans a single QR code, taps one answer, and the venue instantly sees what's working and what isn't. No app download, no account, no friction for the guest.

Unlike a generic form builder or survey tool, iVote was designed from the ground up around **physical spaces and printed materials**: QR codes that never need to be reprinted, feedback that's tied to a specific table or location, and a two-way loop that turns a simple scan into a reward, a public review, or a private conversation with the venue — not just a row in a spreadsheet.

Core promise: *Turn every physical location into a measurable feedback channel.*

This document walks through every feature currently built into the product, explains how it works, and why it matters commercially. It's intended as source material for website copy, sales one-pagers, pitch decks, and AI-assisted content generation.

2. Who It's For

- **Restaurants, cafés, and bars** — table-by-table feedback, service speed, meal satisfaction
- **Gyms and fitness studios** — class quality, facility cleanliness, member sentiment
- **Salons and spas** — visit satisfaction, stylist/therapist ratings
- **Hotels and hospitality venues** — room and stay experience, multi-touchpoint feedback
- **Event organizers and conference operators** — session ratings, return intent, training evaluation
- **Healthcare waiting rooms** — comfort and visit satisfaction without disrupting clinical workflows
- **Retail locations** — in-store experience and product feedback
- **Marketing/creative agencies** — as a white-label feedback product they can offer their own clients

Each of these segments has a purpose-built question template out of the box (see Section 4), so the product feels tailor-made rather than generic from the very first poll a venue creates.

3. The Core Feedback Loop, Explained

The fundamental interaction is intentionally simple, because every extra step loses respondents:

1. **A guest scans a QR code** placed at a table, counter, entrance, or printed on a receipt.
2. **They see one question with a handful of answers**, styled with the venue's own logo and colors.
3. **They tap an answer and submit** — typically in under five seconds, with no login, no app download, and no account required.
4. **The venue sees the result appear on their dashboard immediately**, broken down by location, campaign, and time.
5. **Optionally, the guest is invited to do one more thing** — leave an email for follow-up, enter a prize draw, redeem a reward, or leave a public review — depending on how the venue has configured that specific poll.

Every feature described below plugs into one of these five steps, either making the initial scan-to-vote moment more powerful, or extending what happens immediately after.

4. Core Feedback Experience

One-tap QR voting

The entire respondent journey is a single scan and a single tap. There is no app to install and no account to create, which removes the single biggest source of drop-off in traditional feedback tools. This is the foundation the rest of the product is built on: because responding is nearly frictionless, response rates are dramatically higher than email surveys or comment cards.

Industry-specific poll templates

Instead of starting from a blank question, a venue picks their industry — restaurant, gym, salon, healthcare, event, or general — and gets a ready-made question with sensible answer choices and a matching brand color already applied. A restaurant owner setting up their first poll sees "How was your meal today?" with options like Excellent/Good/Average/Poor, rather than having to invent a question from scratch. This dramatically shortens time-to-first-value for a new customer and makes the product feel purpose-built for their specific business, not a generic form tool repurposed for feedback.

Custom branding per poll

Every poll can carry the venue's own logo, brand name, primary color, and accent color. The voter never has to wonder whose feedback form they're filling out — it looks and feels like it belongs to the venue, which increases trust and completion rates, and reinforces the venue's own brand rather than iVote's.

Multi-language voting

A voter can switch the poll's question and answers into any of nine languages (English, Italian, German, French, Spanish, Portuguese, Arabic, Simplified Chinese, or the original language) with one tap, translated instantly. This is particularly valuable for tourism-heavy venues, international hotels, and multicultural event audiences, where a language barrier would otherwise mean lost feedback entirely.

Flexible question types

A poll can be single-choice, multiple-choice, or allow voters to type in their own free-text answer in addition to the preset options. This means the same underlying tool supports a simple satisfaction score, a "select all that apply" style question, or fully open-ended qualitative feedback — without needing three different products.

Scheduled polls

A poll can be set to open and close automatically at specific dates and times. This is built for time-boxed use cases: a weekend pop-up event, a product launch week, or a promotional campaign that should stop collecting responses the moment it ends, without anyone needing to manually turn it off.

Duplicate & reuse

An existing poll can be cloned in one click, and an existing printed QR code can be reassigned to a brand-new poll. In practice, this means a venue never has to throw away a printed QR poster just because they want to ask a different question — the physical material stays valid indefinitely.

5. QR & Campaign Tools

Reusable QR codes

Every QR code iVote generates points to a stable link that can be reassigned to a different poll at any time. A venue can print one QR poster and change what it asks about weekly, monthly, or in response to a specific issue — without ever reprinting a single sign. This alone removes one of the biggest ongoing costs and headaches of physical feedback campaigns.

Trackable campaigns with placement & variant labels

Each printed QR code can be registered as its own "campaign" with a placement label (lobby, receipt, table tent, restroom, etc.) and an optional variant label (for A/B testing different designs or wording). The dashboard then reports scans, completed votes, and the resulting conversion rate for every single placement separately — so a venue can see, for example, that the QR code by the register converts at 40% while the one on the receipt converts at 12%, and reallocate their printed materials accordingly.

White-label welcome portals

Before a guest even sees the question, they can be shown a fully custom welcome screen — a headline, a short message, and a button label, all written and branded by the venue. This means the entire experience, start to finish, can carry the venue's own voice and identity, with no visible sign that a third-party tool is involved unless the venue chooses to say so.

In-dashboard camera QR scanner

Rather than requiring an admin to leave the app and use their phone's separate camera app, iVote includes a built-in camera scanner directly inside the admin dashboard. Point a phone or laptop camera at any printed QR code and the dashboard instantly shows which poll it's currently pointing to, how many entries it has, and lets the admin redirect it to a different poll on the spot — all without leaving the page.

Bulk QR generation

For venues with many physical locations under one roof — a restaurant with twenty tables, a hotel with fifty rooms — generating twenty individual QR codes one at a time is a real operational burden. Bulk generation lets an admin type a base name and a count, and instantly creates that many uniquely trackable QR codes (Table 1, Table 2, Table 3, and so on), ready to print and place.

Rotating / recurring polls

A single printed QR code can be configured to automatically rotate through an ordered list of polls on a daily or weekly schedule. A venue could, for example, ask a different question every day of the week, or automatically switch a promotional poll after a set number of days — all without any admin having to log in and manually change anything. The QR code on the wall never changes; what it asks does, on autopilot.

AI-generated poster background images (*feature complete, pending API key activation*)

An admin can describe a visual style in plain language — "modern blue city lights for an event poll" — and the system generates a polished, print-ready background image to sit behind the QR code on a printed poster. This removes the need for a venue to hire a designer just to make their QR poster look professional, and turns a plain black-and-white QR code into something that matches their brand aesthetic.

Embeddable feedback widget for any website

A small snippet of code can be pasted into any website — not just a physical venue's own site, but any e-commerce store, SaaS product, or service business — to add a floating "Give Feedback" button. Clicking it opens the exact same voting experience in a slide-up panel, without the visitor ever leaving the page. This is a significant expansion of the addressable market: iVote is no longer limited to businesses with a physical QR-scannable location.

Public "Trust Score" badge

A second embeddable snippet renders a small, live badge — for example, "★ 92% Trust Score · Powered by iVote" — that a venue can place anywhere on their own website. The score is calculated automatically from real voting data. Every time a visitor sees that badge, it's a small, ongoing marketing impression for iVote itself, functioning as a built-in, self-perpetuating referral channel embedded in every customer's own web presence.

6. Feedback Intelligence & Recovery

Automatic alert rules

An admin can define a rule such as "alert me whenever someone gives a score of 3 or below" or "alert me whenever someone selects the answer 'Dissatisfied.'" The moment a matching vote comes in, an alert is created automatically and surfaced on the dashboard — turning feedback monitoring from something a manager has to remember to check into something the system actively pushes in front of them.

Automatic vote-volume anomaly detection

Beyond individual bad reviews, the system runs a daily background check comparing each poll's vote volume this week against the week before. If volume drops by 40% or more — which might indicate a broken QR code, a staff member forgetting to mention it, or a genuine drop in foot traffic — an alert is created automatically, without any rule having to be manually configured. This is an early-warning system for problems a manager might not otherwise notice until much later.

AI sentiment tagging on open-text answers *(feature complete, pending API key activation)*

Whenever a voter types their own free-text answer, it is automatically classified as positive, neutral, or negative. Instead of an admin having to read through every individual comment to get a feel for overall mood, the dashboard shows an instant rollup like "70% positive, 20% neutral, 10% negative, based on 40 answers" for each poll — turning unstructured qualitative feedback into an at-a-glance metric.

Benchmark reports

A venue's own average score on a given question template can be compared against an anonymized average calculated from other venues using that same template, provided enough other venues exist in the dataset to preserve anonymity. This lets a venue answer a question no competitor tool can: "is our 82% satisfaction score actually good, or is that just average for our industry?" — a uniquely defensible feature that depends entirely on the platform's own aggregated data.

Feedback recovery workflow

Any alert can be converted into a named recovery task — for example, "Call the customer who complained about slow service" — and tracked through Open, In Progress, and Done states. This closes the gap between "we noticed a problem" and "we actually did something about it," and gives a manager a simple accountability trail for how negative feedback was handled.

Weekly email reports

Every Monday, an automated summary email is generated and sent to the workspace's designated recipient, covering total polls, votes collected in the last seven days, open feedback alerts, and open recovery tasks. This means a busy owner or manager never has to log in to stay informed — the key numbers arrive in their inbox on a predictable schedule.

"We heard you" closed-loop public updates

A venue can post a short, public update — for example, "We heard you and fixed the slow Wi-Fi in the lounge" — which then appears automatically on that poll's public results page for any guest to see. Publicly and visibly closing the loop on feedback is one of the most effective ways to build guest trust, because it proves feedback isn't just being collected, it's being acted on.

Private voter messages to the organizer

While voting, a guest can optionally write a short private message directly to the venue, with an optional email address for a reply. This gives frustrated guests a low-friction, private channel to vent or ask for help before they ever consider posting a public complaint — often defusing a situation that would otherwise have become a public one-star review.

7. Engagement & Growth Tools

Post-vote rewards

A venue can configure any poll to show a custom thank-you reward immediately after voting — a message, a discount code, and/or a link to redeem it. This is entirely optional and fully controlled by the admin, who decides both whether a reward exists at all and exactly what it is, per poll. It transforms the end of a feedback interaction from a dead end into a concrete incentive to come back.

Reward redemption tracking

When a customer shows their reward code in person, staff can enter it into the dashboard to mark it redeemed, and the system keeps a running count of how many times each code has actually been used. This turns "we're offering a reward" into measurable proof that the reward is genuinely driving repeat visits, which is exactly the kind of evidence a venue owner needs to justify continuing — or expanding — the program.

Prize draws / raffles

As an alternative or complement to a fixed reward, a venue can enable an opt-in prize draw on any poll, describe the prize, and let voters enter by leaving their email with consent. When ready, the admin clicks "Pick a winner" and the system randomly selects one verified entrant. Prize draws are a well-established tactic for meaningfully boosting response rates, because the incentive to participate is a chance at something bigger rather than a small guaranteed discount.

Smart review routing

The system can automatically route voters based on how positive their answer was: guests who gave a favorable response are shown a "leave us a public review" link, while guests whose answer was less positive are instead shown a private acknowledgment and kept out of the public review funnel. This is designed to increase the volume of genuine public reviews from happy customers while keeping constructive criticism in a private channel where it can actually be acted on.

Opt-in lead capture with explicit consent

At the point of voting, a guest can choose to leave their email address specifically to be contacted again, with an explicit consent checkbox built directly into the flow. Nothing is captured without deliberate, informed opt-in, which keeps the feature compliant with modern privacy expectations while still giving venues a legitimate way to build a contactable audience from real, engaged customers.

Automated lead nurture emails

Once a guest opts in, the venue can configure a subject line and message that gets sent to them automatically and immediately — no manual follow-up required. A guest who just left positive feedback and their email can receive a personalized thank-you or offer within moments, while the experience is still fresh in their mind, without anyone at the venue having to lift a finger.

8. Business, Team & Monetization Features

Multi-tenant secure workspaces

Every venue operates inside its own fully isolated workspace, with data access enforced at the database level rather than just in the application code. This means one customer's votes, polls, and settings are architecturally guaranteed to be invisible to every other customer — a foundational trust requirement for any business handling customer feedback data.

Role-based team access

Within a workspace, team members can be assigned Owner, Editor, or Viewer roles, each with a different set of permissions — for example, only owners and editors can delete polls or manage billing, while viewers can see everything but change nothing. This lets a venue safely bring on staff or managers without giving everyone full control.

Real email team invitations

Adding a colleague isn't just a note in a list — entering their email sends them an actual account invitation, so they get their own secure login rather than sharing a single password across a team. This is a real prerequisite for confidently selling multi-seat plans to a business.

Three-tier subscription plans

The product is structured around Free, Starter, and Growth tiers, fully wired into Stripe for billing, with plan-based limits already enforced on the number of polls and QR campaigns a workspace can create. The monetization foundation is not a future project — it already works end-to-end.

Workspace webhooks

A venue can paste in a webhook URL, and every new vote is automatically forwarded there as structured data — enabling a one-time setup that connects iVote to Slack, Zapier, Google Sheets, or virtually any other tool a business already uses, without iVote having to build a dedicated integration for each one individually.

Developer API with secure API keys

A workspace can generate its own API key and use it to pull a summary of their poll and vote data programmatically from a dedicated endpoint. This is a small but important checkbox feature for larger, more technical customers who want to build their own internal dashboards or connect iVote to custom internal systems.

CSV export

Full poll results can be exported to CSV at any time, giving venues complete ownership and portability of their own data — removing a common objection during sales conversations about vendor lock-in.

Audit log

Every significant administrative action taken inside a workspace is recorded and viewable, giving teams a clear accountability trail of who changed what and when.

9. Trust, Compliance & Platform Quality

Content moderation

Open-text answers are automatically screened for political, religious, or sexual content before they're accepted, and any guest can report an existing answer they find inappropriate for manual review. This keeps public-facing, crowd-sourced answer lists safe and usable without requiring constant manual moderation.

Optional automatic vote retention window

A workspace can set an optional number of days after which old votes are automatically and permanently deleted by a scheduled background job. This is a genuine, concrete data-minimization control that matters directly to privacy-conscious buyers and is often a specific requirement in EU and enterprise procurement conversations.

Privacy, Terms, and Support pages

The legal and support foundation a real business needs — a privacy policy, terms of service, and a support page — is already built and live, rather than being an afterthought bolted on right before launch.

Installable app (PWA)

iVote can be installed directly onto a phone or desktop home screen like a native app, with no app store submission required, giving venues and their staff a persistent, one-tap way to reach their dashboard.

Mobile-first, tab-organized admin dashboard

The admin experience is organized into five clear tabs — Overview, Polls, Engagement & Growth, Feedback, and Settings — so that as the feature set has grown substantially, the day-to-day experience of running a single poll and printing a QR code has stayed simple and uncluttered rather than becoming an overwhelming wall of options.

Live error monitoring

Application errors are tracked in real time through integrated monitoring, so problems can be identified and fixed proactively rather than being discovered only when a customer complains.

10. What Makes iVote Different

1. **It's a two-way loop, not just a survey tool.** Rewards, prize draws, review routing, and public "we heard you" updates all close the loop back to the guest — most QR feedback tools stop at data collection and leave the venue to figure out what to do next on their own.
 2. **It's built for physical locations first.** Reusable QR codes, rotating polls, bulk QR generation, and per-location analytics are designed around the reality of printed materials and real venues, not just repurposed from a generic online form builder.
 3. **It gets smarter over time.** Anomaly detection, AI sentiment tagging, and benchmark reports turn raw feedback into proactive insight instead of a spreadsheet someone has to read and interpret manually every week.
 4. **It's already enterprise-shaped.** Multi-tenant security, team roles, a developer API, webhooks, and compliance controls like data retention are in place from day one — the platform can grow from a single independent café to a multi-location chain without needing to be rebuilt from scratch.
-

11. Current Status (for internal marketing planning)

Live and fully working today: every feature described above, with two clearly marked exceptions.

Built and code-complete, awaiting activation:

- AI-generated QR poster background images (waiting on an OpenAI API key)
- AI sentiment tagging on open-text answers (same dependency)

Not yet built (roadmap candidates for future messaging, not current claims):

- A true multi-location "chain" roll-up dashboard for franchises managing many separate venues from one parent account
- An agency/white-label reseller program
- Custom domains per venue
- SMS-based feedback that doesn't require a QR scan
- Native mobile app packaging for the app stores
- Formal accessibility (WCAG) certification

This document was generated to support marketing content creation — website copy, sales one-pagers, social content, and pitch decks. All feature descriptions reflect the current, working state of the product as of the date above.
